

AdocNet v1.0.0-beta.3 — PDF Showcase

Typography and Unicode

This document demonstrates the new PDF rendering features in beta.3. The text you're reading is fully justified with improved line-breaking rules. Punctuation like periods, commas, and closing parentheses (like this) will never appear at the start of a wrapped line.

Unicode text works with TrueType fonts: cafe resume naive. Special characters: copyright ©, registered ®, trademark ™. Typographic quotes, em dashes — and ellipsis... are supported.

Text Formatting

This paragraph has **bold text** , *italic text* , monospace text , and combinations of ***bold italic*** formatting. You can also use superscript and subscript notation.

Hyperlinks

Visit <https://github.com> for source code hosting. See the AsciiDoc website for the markup specification. The Microsoft Docs are a great .NET reference.

Lists

Unordered List

- First item with some text - Second item that is longer and contains enough words to demonstrate how list items wrap across multiple lines when the content exceeds the available width - Third item **Nested sub-item A** Nested sub-item B

Ordered List

1. Step one: prepare the environment
2. Step two: configure the options
3. Step three: render the document
4. Step four: verify the output

Code Blocks

Here is a C# code example with syntax highlighting label:

```
csharp
var options = new PdfRenderOptions
{
    FontSize = 11f,
    TitleFontSize = 24f,
    HeadingScale = 0.85f,
    LineSpacing = 1.35f,
    ShowPageNumbers = true,
    FooterText = "Page {page} of {pages}",
    LinkColor = new PdfColor(0f, 0f, 0.8f),
};

byte[] pdf = new PdfRenderer()
    .RenderToBytes(document, options);
```

And a simple literal block:

```
This is a literal block.
It preserves      spacing and
line breaks exactly as written.
```

Tables

Simple Table

Feature	Status	Notes
TrueType fonts	Complete	Embedding with subsetting
Image embedding	Complete	JPEG and PNG with alpha
Hyperlinks	Complete	URI annotations
Text quality	Complete	Punctuation rules, justification cap
Table improvements	Complete	Header repeat, cell wrapping
Headers/footers	Complete	Page numbers with {pages} total
Configuration	Complete	10 new PdfRenderOptions properties

Column-Weighted Table

Key	Description
FontSize	Base body text font size in points. Default is 11. Controls the size of paragraph text throughout the document.
HeadingScale	Scale factor applied to each heading level. H2 = TitleFontSize x scale, H3 = H2 x scale, and so on. Default 0.85.
LineSpacing	Line spacing multiplier. The leading (distance between baselines) is calculated as fontSize x lineSpacing. Default 1.35.

Admonitions

NOTE:

This document showcases all the new features added in beta.3 of AdocNet's PDF renderer.

TIP:

Use `PdfRenderOptions` to customize every aspect of the PDF output, from page size to font sizes to visual styling.

WARNING:

Interlaced PNGs are not supported. The renderer will fall back to a placeholder for these images.

IMPORTANT:

PDF output is fully deterministic. Rendering the same document twice always produces byte-identical output.

Block Quotes

The PDF renderer is a pure managed PDF 1.4 writer with no external dependencies. It writes PDF primitives directly: streams, objects, and cross-reference tables. All output is deterministic.

Description Lists

Font embedding

TrueType fonts are parsed, subsetting to include only used glyphs, and embedded as CIDFontType2 objects with ToUnicode CMaps for proper text extraction.

Image support

JPEG images use DCTDecode (raw passthrough). PNG images are decompressed, de-filtered, and re-compressed with FlateDecode. RGBA PNGs get a separate SMask for transparency.

Page layout

The renderer uses a simple vertical flow model with configurable page size, margins, and content width. No floats or multi-column support.

Conclusion

This document has demonstrated:

1. TrueType font support with Unicode text
2. JPEG and PNG image embedding
3. Clickable hyperlinks with URI annotations
4. Improved text justification with punctuation rules
5. Table rendering with cell wrapping and header repetition
6. Headers and footers with page numbers

7. Configurable typography and visual styling
8. Code blocks with language labels
9. Admonitions, block quotes, and description lists

All rendered by a pure managed C# PDF writer with zero external dependencies.
